

Double Check Inventory

- **Save Time**
- **Save Money**

- **Specifically designed for public warehouses**
- **Eliminates data entry**
- **Count only designated locations**
- **Count only designated items**

Physical inventories are frustrating, expensive, and necessary. Double Check will greatly reduce the errors and time required to perform this essential task. While it will not reduce the time required to count the inventory, it eliminates the data entry and the resulting errors it produces.

Unlike traditional inventory systems, Double Check lets you count only the locations and items you select. For public warehouses with multiple clients, this lets you perform an auditable, physical inventory of just one client's items. Instead of using multipart paper tags, Double Check produces barcoded inventory control labels. These labels are similar to the tags, and each label is uniquely numbered to allow for auditing. The difference is the tags are barcoded and can be quickly and accurately scanned.

The tags also make it possible to use barcode scanners on items that are not barcoded or poorly marked. Products from small manufactures and foreign markets often lack outer barcode markings. Double Check lets you identify products by SKU or receiving lot number before you start the physical count. You then print out the inventory labels and pre-attach them to the items or bin locations prior to counting.
